I solve and type exercises from different places (read *books*).

1 Algebraic Geometry - Hartshorne

1.1 Chapter I - Varieties

Exercise 1 (Exercise 1.1)**.** a) Let Y be the plane curve $y = x^2$. Show that $A(Y)$ is isomorphic to a polynomial ring in one variable over k.

b) Let Z be the plane curve $xy = 1$. Show that $A(Z)$ is not isomorphic to a polynomial ring in one variable over k.

c) Let f be any irreducible quadratic polynomial in $k[x, y]$, and let W be the conic defined by f. Show that $A(W)$ is isomorphic to $A(Y)$ or $A(Z)$. Which one is it when?

♠

Solution 1. a) We have $A(Y) = k[x, y]/(y - x^2)$. An isomorphism $A(Y) \to k[t]$ is given by $x \mapsto t$ and $y \mapsto t^2$.

b) We have $A(Z) = k[x, y]/(xy - 1) \simeq k[x, \frac{1}{x}]$. So we must show that $k[x, \frac{1}{x}] \not\approx k[x]$. It can be computed that the first one has automorphisms given by $x \mapsto cx^n$ for c nonzero and $n \neq 0$. The second has as automorphisms $ax + b$ ($a \neq 0$). So the first one have an abelian automorphism group, the second has not.

c) It is seen by tedious calculations that any quadric in $\mathbb{A}^2$ can be reduced to one of the form

$$x^2 + bxy + y^2 - c = 0$$

by linear transformations. [[[[[[[[[HOW TO DO THE REST??]]]]

♡

1.2 Chapter II - Schemes

Exercise 2 (Excercise 7.1)**.** Let $(X, \mathscr{O}_X)$ be a locally ringed space and let $f : \mathscr{L} \to \mathscr{M}$ be a surjective map of invertible sheaves on X. Show that f is an isomorphism. ♠

Solution 2. Since $\mathscr{L}, \mathscr{M}$ are invertible, we have isomorphisms $\mathscr{L}_x \approx \mathscr{O}_{X,x}$ and $\mathscr{M}_x \approx \mathscr{O}_{X,x}$ for each $x \in X$.

But $\mathrm{Hom}_{\mathscr{O}_{X,x}}(\mathscr{O}_{X,x}, \mathscr{O}_{X,x}) = \mathscr{O}_{X,x}$, that is, all homomorphisms are given by multiplication by some $h \in \mathscr{O}_{X,x}$. But since f was surjective, we conclude that h is outside $\mathfrak{m}_x$, the maximal ideal of $\mathscr{O}_{X,x}$. But then h is a unit, so f is an isomorphism. ♡

1.3 Chapter III

Exercise 3 (Exercise 4.3)**.** Let $X = \mathbb{A}^2_k = \operatorname{Spec} k[x,y]$ and let $U = X \backslash \{(0,0)\}$. Use a suitable open cover of X by open affine subsets to show that $H^1(U, \mathscr{O}_U)$ is isomorphic to the k-vector space spanned by $\{x^i y^j \mid i, j < 0\}$. In particular, it is infinitedimensional, and so U cannot be affine (not projective either). ♠

Solution 3. We can cover U by $U_1 = \mathbb{A}^2 \backslash \{x = 0\}$ and $U_2 = \mathbb{A}^2 \backslash \{y = 0\}$. We have $U_1 \cap U_2 = \mathbb{A}^2 \backslash \{xy = 0\}$. Also, $\mathscr{O}(U_1) = k[x, y, \frac{1}{x}]$ and $\mathscr{O}(U_2) = k[x, y, \frac{1}{y}]$ and $\mathscr{O}(U_1 \cap U_2) = k[x, y, \frac{1}{xy}]$. Then the Čech complex takes the form

$$0 \to k[x, y, \frac{1}{x}] \times k[x, y, \frac{1}{y}] \xrightarrow{d} k[x, y, \frac{1}{xy}] \to 0,$$

the differential being difference. Then $H^1(U, \mathscr{O}_U)$ can be computed as the homology at the second term. But nothing on the left side can hit anything of the form $x^i y^j$ with $i, j < 0$. Anything else is hit. Thus we have

$$H^1(U, \mathscr{O}_U) \simeq \{x^i y^j \mid i, j < 0\}$$

as k-vector spaces. ♡

1.4 Chapter IV

Exercise 4 (Exercise 1.1)**.** Let X be a curve and $P \in X$ a point. Show that there exists a nonconstant rational function $f \in K(X)$ which is regular everywhere except at P. ♠

Solution 4. Let D be the divisor $D = nP$. The linear system

$$\{E = D + f \geq 0\}$$

consists of all divisors linearly equivalent to D. But these are classified by those f with $(f) \geq -nP$, i.e. those f with at most poles of order n at P.

By Riemann-Roch we have

$$l(D) - l(K - D) = \deg D + 1 - g = n + 1 - g.$$

If n is large enough, $K - D$ will have negative degree, so $l(K - D) = 0$. Thus for large n, we can get $l(D)$ as big as we want.

♡

2 Commutative Algebra - Eisenbud

2.1 Chapter 16 - Modules of Differentials

Exercise 5 (Exercise 16.1)**.** Show that if $b \in S$ is an idempotent ($b^2 = b$), and $d : S \to M$ is any derivation, then $db = 0$. ♠

Solution 5. This is trivial. $db = d(b^2) = 2db$. If $2 = 0$, then the statement is automatically true. If not, then $db = 0$ by subtraction. ♡

3 Deformation Theory - Hartshorne

3.1 Chapter I.3 - The T^i functors

Exercise 6 (Exercise 3.1)**.** Let $B = k[x, y](xy)$. Show that $T^1(B/k, M) = M \otimes k$ and $T^2(B/k, M) = 0$ for any B-module M. ♠

Solution 6. Since B is defined by a principal ideal in $P = k[x, y]$, it follows that $L_2 = 0$ in the cotangent complex. Thus $T^2(B/k, M)$ is automatically zero.

We have that $L_1 = B$ and $L_0 = Bdx \oplus Bdy$ with d_1 being $f \mapsto (fy, fx)$. Applying $\mathrm{Hom}(-, M)$, we get $\mathrm{Hom}(L_0, M) = M \oplus M$ and $\mathrm{Hom}(L_1, M) = M$.

We have $\mathrm{Hom}(B \oplus B, M) \simeq M \oplus M$ by $\phi \mapsto (\phi(1, 0), \phi(0, 1)$. We have a diagram

$$\begin{tikzcd}
\mathrm{Hom}(B \oplus B, M) \arrow[r, "\psi^*"] \arrow[d, "\simeq"'] & \mathrm{Hom}(B, M) \arrow[d, "\simeq"] \\
M \oplus M \arrow[r] & M
\end{tikzcd}$$

Under these isomorphisms, it is easy to see that the bottom map is given by

$$(\phi(1,0), \phi(0,1)) \mapsto y\phi(1,0) + x\phi(0,1).$$

Thus since T^1 is the cokernel of this map, we must have $T^1(B/k, M) = M \otimes k$. $\heartsuit$

Exercise 7 (Exercise 3.3)**.** Let $B = k[x,y]/(x^2, xy, y^2)$. Show that $T^0(B/k, B) = k^4$, $T^1(B/k, B) = k^4$ and $T^2(B/k, B) = k$. $\spadesuit$

Solution 7. Let's compute L_2 first. For that we need part of a resolution of I. We have in fact

$$0 \to \operatorname{im} \begin{pmatrix} -y & 0 \\ x & -y \\ 0 & x \end{pmatrix} \to P(-2)^3 \to I \to 0.$$

The Koszul relations are given by

$$\operatorname{im} \begin{pmatrix} -y^2 & -xy & 0 \\ 0 & x^2 & -y^2 \\ x^2 & 0 & xy \end{pmatrix}.$$

Let's compute Q/F_0 (relations modulo Koszul relations). Since Q is generated in degree 3, and F_0 is of degree 4, we have $\dim_k(Q/F_0)_3 = 2$. Let's consider degree 4. As a k-vector space Q_4 is spanned by the four elements

$$\begin{pmatrix} -y^2 \\ xy \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ -y^2 \\ xy \end{pmatrix}, \begin{pmatrix} -yx \\ x^2 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ -yx \\ x^2 \end{pmatrix}.$$

The two in the middle are already Koszul relations, so that $(Q/F_0)_4$ have dimension ≤ 2. But we also have

$$\begin{pmatrix} -y^2 \\ xy \\ 0 \end{pmatrix} = \begin{pmatrix} 0 \\ yx \\ -x^2 \end{pmatrix} + \begin{pmatrix} -y^2 \\ 0 \\ x^2 \end{pmatrix}.$$

Thus $\dim_k(Q/F_0)_4 = 1$, since the second term above is a Koszul relation. Similarly we find that $\dim_k(Q/F_0)_5 = 0$. Hence, L_2 is the 3-dimensional k-vector space spanned by Q_3 and one more relation. L_1 is $F \otimes B = B^3$, and L_0 is $B \oplus B$, spanned by dx, dy.

Taking duals, we get that $L_2 = \mathrm{Hom}(Q/F_0, B)$. This set can be identified with

$$\begin{aligned}\mathrm{Hom}(Q/F_0, B) &= \{\varphi : Q \to B \mid \varphi\big|_{F_0} = 0\} \\ &= \{\varphi : Q \to P \mid \mathrm{im}\, f\big|_{F_0} \subseteq I\}\end{aligned}$$

Thus, since $I = \mathfrak{m}^2$, we must have that φ sends the two generators of Q to something of degree 1 (degree 0 is not ok, since then F_0 would be sent outside I). Thus $\mathrm{Hom}(Q/F_0, B)$ is $2 \times 2 = 4$-dimensional, spanned by

$$\mathrm{im}\begin{pmatrix} y & x & 0 & 0 \\ 0 & 0 & x & y \end{pmatrix}.$$

But d_2 is the dual of the inclusion $Q \to F$ from the exact sequence above. The dual is given by transposing, and we are left with one column - in conclusion, $T^2(B/k, B)$ is one-dimensional.

The Jacobian of I is given by

$$\begin{pmatrix} 2x & y & 0 \\ 0 & x & 2y \end{pmatrix},$$

and it is easily seen that the kernel of $\mathrm{Jac} \otimes B$ is given by $\mathfrak{m} \oplus \mathfrak{m} \oplus \mathfrak{m} \subset B^3$. The two relations kill off two dimensions, so $\dim_k T^1(B/k, B) = \dim_k \mathfrak{m}^{\oplus 3} - 2 = 6 - 2 = 4$.

Also $T^0(B/k, B)$ is B^2 modulo the image of the Jacobian. The constants are left untouched, so $\dim_k T^0(B/k, B) = 2 + 2 + 2 - 3 = 3$. A basis is given by $(1, 0), (0, 1)$ and (x, y). (thus Hartshorne is wrong?) ♡

4 Introduction to Commutative Algebra - Atiyah-MacDonald

4.1 Chapter 1 - Rings and ideals

Exercise 8. Let x be a nilpotent element of a ring A. Show that $1 + x$ is a unit of A. Deduce that the sum of a nilpotent element and a unit is a unit. ♠

Solution 8. Suppose $x^{n+1} = 0$ and that $x^n \neq 0$. Consider

$$s = 1 - x + x^2 - x^3 + \ldots + x^n$$

Then

$$sx = x - x^2 + x^3 - x^4 + \ldots - x^n$$

since $x^{n+1} = 0$. But then $s + sx = 1$, so that $s(1+x) = 1$. Hence $1 + x$ is a unit. To prove that the sum of any unit and any nilpotent is a unit, note that if u is any unit, then $u^{-1}x$ is still nilpotent. So since $u+x = u(1+u^{-1}x)$ and product of units are units, the claim follows. ♡

4.2 Chapter 2 - Modules

Exercise 9 (Excercise 1)**.** Show that $\mathbb{Z}/m \otimes_Z \mathbb{Z}/n = 0$ if m, n are coprime. ♠

Solution 9. Write $1 = am + bn$. Then

$$\begin{aligned} 1 \otimes 1 = (am + bn) \otimes 1 &= am \otimes 1 + bn \otimes 1 \\ &= 0 + bn \otimes 1 = 1 \otimes bn = 1 \otimes 0 = 0. \end{aligned}$$

And we are done. ♡

Exercise 10 (Exercise 2)**.** Let A be a ring, $\mathfrak{a}$ an ideal, and M an A-module. Then $(A/\mathfrak{a}) \otimes_A M$ is isomorphic to $M/\mathfrak{a}M$. ♠

Solution 10. Start with

$$0 \to \mathfrak{a} \to A \to A/\mathfrak{a} \to 0.$$

Tensoring with M gives

$$\mathfrak{a} \otimes M \to M \to A/\mathfrak{a} \otimes_A M \to 0.$$

But $\mathfrak{a} \otimes_A M \simeq \mathfrak{a}M$, so that the sequence reads $A/\mathfrak{a} \otimes M \simeq M/\mathfrak{a}M$. ♡

Exercise 11 (Exercise 3)**.** Let A be a local ring, M, N finitely generated A-modules. Prove that if $M \otimes N = 0$, then $M = 0$ or $N = 0$. ♠

Solution 11. First a counterexample if A is not a local ring. Let $A = k[x]$ and $M = k[x]/(x-1)$ and $N = k[x]/(x)$. We can write $1 = -(x-1)+x$. Then $M \otimes_A N = 0$ by the same method as in Exercise 1 ($1 \otimes 1 = (-x+1+x) \otimes 1 = x \otimes 1 = 1 \otimes x = 0$).

Let $M_k := M \otimes k = M/\mathfrak{m}M$. By Nakayama's lemma, $M_k = 0 \Rightarrow M = 0$.

So suppose $M \otimes_A N = 0$. Then $(M \otimes_A N)_k = 0$. But this is isomorphic to $M_k \otimes_A N_k$ since $k \otimes_A k = k$. But $M_k \otimes_A N_k \simeq M_k \otimes_k N_k$, as k-modules, since everything in $\mathfrak{m}$ acts trivially on M_k. But these are vector spaces over a field, now we must have $M_k = 0$ or $N_k = 0$, and by Nakayama we are done. $\heartsuit$
