# Algebraic Geometry Buzzlist

## Fredrik Meyer

# 1 Algebraic Geometry

## 1.1 General properties

## 1.1.1 Complete variety

Let X be an integral, separated scheme over a field k. Then X is **complete** if is proper.

## 1.1.2 Crepant resolution

A **crepant resolution** is a resolution of singularities  $f: X \to Y$  that does not change the canonical bundle, i.e. such that  $\omega_X \simeq f^*(\omega_Y)$ .

## 1.1.3 Dominant map

A rational map  $f: X \rightarrow Y$  is **dominant** if its image (or precisely: the image of one of its representatives) is dense in Y.

#### 1.1.4 Genus

The **geometric genus** of a smooth, algebraic variety, is defined as the number of sections of the canonical sheaf, that is, as  $H^0(V, \omega_X)$ . This is often denoted  $p_X$ .

## 1.1.5 Hodge numbers

If X is a complex manifold, then the **Hodge numbers**  $h^{pg}$  of X are defined as the dimension of the cohomology groups  $H^p(X, \Omega_X^q)$ .

### 1.1.6 Normal variety

A variety X is **normal** if all its local rings are **normal** rings.

#### 1.1.7 Proper morphism

A morphism  $f: X \to Y$  is **proper** if it separated, of finite type, and universally closed.

#### 1.1.8 Resolution of singularities

A morphism  $f: X \to Y$  is a **resolution of singularities of** Y if X is non-singular and f is birational and proper.

#### 1.1.9 Separated morphism

Let  $f: X \to Y$  be a morphism of schemes. Let  $\Delta: X \to X \times_Y X$  be the diagonal morphism. We say that f is **separated** if  $\Delta$  is a closed immersion.

#### 1.2 Results and theorems

#### 1.2.1 Adjunction formula

Let X be a smooth algebraic variety Y a smooth subvariety. Let  $i: Y \hookrightarrow X$  be the inclusion map, and let  $\mathcal{I}$  be the corresponding ideal sheaf. Then  $\omega_Y = i^* \omega_X \otimes_{\mathscr{O}_X} \det(\mathcal{I}/\mathcal{I}^2)^\vee$ , where  $\omega_Y$  is the canonical sheaf of Y.

In terms of canonical classes, the formula says that  $K_D = (K_X + D)|_D$ . Here's an example: Let X be a smooth quartic surface in  $\mathbb{P}^3$ . Then  $H^1(X, \mathcal{O}_X) = 0$ . The divisor class group of  $\mathbb{P}^3$  is generated by the class of a hyperplane, and  $\mathcal{K}_{\mathbb{P}^3} = -4H$ . The class of X is then 4H since X is of degree 4. X corresponds to a smooth divisor D, so by the adjunction formula, we have that

$$K_D = (K_{\mathbb{P}^3} + D)|_D = -4H + 4H|_D = 0.$$

Thus X is an example of a K3 surface.

#### 1.2.2 Bertini's Theorem

Let X be a nonsingular closed subvariety of  $\mathbb{P}^n_k$ , where  $k = \bar{k}$ . Then the set of of hyperplanes  $H \subseteq \mathbb{P}^n_k$  such that  $H \cap X$  is regular at every point) and such that  $H \not\subseteq X$  is a dense open subset of the complete linear system |H|. See [3, Thm II.8.18].

#### 1.2.3 Euler sequence

If A is a ring and  $\mathbb{P}_A^n$  is projective n-space over A, then there is an exact sequence of sheaves on X:

$$0 \to \Omega_{\mathbb{P}^n_A/A} \to \mathscr{O}_{\mathbb{P}^n_A}(-1)^{n+1} \to \mathscr{O}_{\mathbb{P}^n_A} \to 0.$$

See [3, Thm II.8.13].

#### 1.2.4 Kodaira vanishing

If k is a field of characteristic zero, X is a smooth and projective k-scheme of dimension d, and  $\mathcal{L}$  is an ample invertible sheaf on X, then  $H^q(X, \mathcal{L} \otimes_{\mathscr{O}_X} \Omega^p_{X/k}) = 0$  for p+q>d. In addition,  $H^q(X, \mathcal{L}^{-1} \otimes_{\mathscr{O}_X} \Omega^p_{X/k}) = 0$  for p+q< d.

## 1.2.5 Lefschetz hyperplane theorem

Let X be an n-dimensional complex projective algebraic variety in  $\mathbb{P}^n_{\mathbb{C}}$  and let Y be a hyperplane section of X such that  $U = X \setminus Y$  is smooth. Then the natural map  $H^k(X,\mathbb{Z}) \to H^k(Y,\mathbb{Z})$  in singular cohomology is an isomorphism for k < n-1 and injective for k = n-1.

### 1.2.6 Riemann-Roch for curves

The **Riemann-Roch theorem** relates the number of sections of a line bundle with the genus of a smooth curve C. Let  $\mathcal{L}$  be a line bundle  $\omega_C$  the canonical sheaf on C. Then

$$h^0(C, \mathcal{L}) - h^0(C, \mathcal{L}^{-1} \otimes_{\mathscr{O}_C} \omega_C) = \deg(\mathcal{L}) + 1 - g.$$

This is [3, Theorem IV.1.3].

#### 1.2.7 Semi-continuity theorem

Let  $f: X \to Y$  be a projective morphism of noetherian schemes, and let  $\mathscr{F}$  be a coherent sheaf on X, flat over Y. Then for each  $i \geq 0$ , the function  $h^i(y,\mathscr{F}) = \dim_{k(y)} H^i(X_y,\mathscr{F}_y)$  is an upper semicontinuous function on Y. See [3, Chapter III, Theorem 12.8].

#### 1.2.8 Serre vanishing

One form of Serre vanishing states that if X is a proper scheme over a noetherian ring A, and  $\mathcal{L}$  is an ample sheaf, then for any coherent sheaf  $\mathscr{F}$  on X, there exists an integer  $n_0$  such that for each i > 0 and  $n \geq n_0$  the group  $H^i(X, \mathscr{F} \otimes_{\mathscr{O}_X} \mathcal{L}^n) = 0$  vanishes. See [3, Proposition III.5.3].

## 1.3 Sheaves and bundles

#### 1.3.1 Ample line bundle

A line bundle  $\mathcal{L}$  is **ample** if for any coherent sheaf  $\mathscr{F}$  on X, there is an integer n (depending on  $\mathscr{F}$ ) such that  $\mathscr{F} \otimes_{\mathscr{O}_X} \mathcal{L}^{\otimes n}$  is generated by global sections. Equivalently, a line bundle  $\mathcal{L}$  is ample if some tensor power of it is very ample.

#### 1.3.2 Invertible sheaf

A locally free sheaf of rank 1 is called **invertible**. If X is normal, then, invertible sheaves are in 1-1 correspondence with line bundles.

#### 1.3.3 Anticanonical sheaf

The anticanonical sheaf  $\omega_X^{-1}$  is the inverse of the canonical sheaf  $\omega_X$ , that is  $\omega_X^{-1} = \mathscr{H} \mathrm{om}_{\mathscr{O}_X}(\omega_X, \mathscr{O}_X)$ .

#### 1.3.4 Canonical class

The canonical class  $K_X$  is the class of the canonical sheaf  $\omega_X$  in the divisor class group.

#### 1.3.5 Canonical sheaf

If X is a smooth algebraic variety of dimension n, then the canonical sheaf is  $\omega := \wedge^n \Omega^1_{X/k}$  the n'th exterior power of the cotangent bundle of X.

## 1.3.6 Sheaf of holomorphic p-forms

If X is a complex manifold, then the **sheaf of of holomorphic** p-forms  $\Omega_X^p$  is the p-th wedge power of the cotangent sheaf  $\wedge^p \Omega_X^1$ .

#### 1.3.7 Normal sheaf

Let  $Y \hookrightarrow X$  be a closed immersion of schemes, and let  $\mathcal{I} \subseteq \mathscr{O}_X$  be the ideal sheaf of Y in X. Then  $\mathcal{I}/\mathcal{I}^2$  is a sheaf on Y, and we define the sheaf  $\mathcal{N}_{Y/X}$  by  $\mathscr{H}om_{\mathscr{O}_Y}(\mathcal{I}/\mathcal{I}^2, \mathscr{O}_Y)$ .

### 1.3.8 Reflexive sheaf

A sheaf  $\mathscr{F}$  is **reflexive** if the natural map  $\mathscr{F} \to \mathscr{F}^{\vee\vee}$  is an isomorpism. Here  $\mathscr{F}^{\vee}$  denotes the sheaf  $\mathscr{H}\mathrm{om}_{\mathscr{O}_X}(\mathscr{F},\mathscr{O}_X)$ .

#### 1.3.9 Very ample line bundle

A line bundle  $\mathcal{L}$  is **very ample** if there is an embedding  $i: X \hookrightarrow \mathbb{P}^n_S$  such that the pullback of  $\mathscr{O}_{\mathbb{P}^n_S}(1)$  is isomorphic to  $\mathcal{L}$ . In other words, there should be an isomorphism  $i^* \mathscr{O}_{\mathbb{P}^n_S}(1) \simeq \mathcal{L}$ .

## 1.4 Toric geometry

## 1.4.1 Polarized toric variety

A toric variety equipped with an ample T-invariant divisor.

#### 1.4.2 Toric variety associated to a polytope

There are several ways to do this. Here is one: Let  $\Delta \subset M_{\mathbb{R}}$  be a convex polytope. Embed  $\Delta$  in  $M_R \times \mathbb{R}$  by  $\Delta \times \{1\}$  and let  $C_{\Delta}$  be the cone over  $\Delta \times \{1\}$ , and let  $\mathbb{C}[C_{\Delta} \cap (M \times \mathbb{Z})]$  be the corresponding semigroup ring. This is a semigroup ring graded by the  $\mathbb{Z}$ -factor. Then we define  $\mathbb{P}_{\Delta} = \operatorname{Proj} \mathbb{C}[C_{\Delta} \cap (M \times \mathbb{Z})]$  to be the toric variety associated to a polytope.

## 1.5 Types of varieties

#### 1.5.1 Abelian variety

A variety X is an **abelian variety** if it is a connected and complete algebraic group over a field k. Examples include elliptic curves and for special lattices  $\Lambda \subset \mathbb{C}^{2g}$ , the quotient  $\mathbb{C}^{2g}/\Lambda$  is an abelian variety.

#### 1.5.2 Calabi-Yau variety

In algebraic geometry, a Calabi-Yau variety is a smooth, proper variety X over a field k such that the canonical sheaf is trivial, that is,  $\omega_X \simeq \mathscr{O}_X$ , and such that  $H^j(X, \mathscr{O}_X) = 0$  for  $1 \leq j \leq n-1$ .

#### 1.5.3 del Pezzo surface

A del Pezzo surface is a 2-dimensional Fano variety. In other words, they are complete non-singular surfaces with ample anticanonical bundle. The degree of the del Pezzo surface X is by definition the self intersection number K.K of its canonical class K.

#### 1.5.4 Elliptic curve

An elliptic curve is a smooth, projective curve of genus 1. They can all be obtained from an equation of the form  $y^2 = x^3 + ax + b$  such that  $\Delta = -2^4(4a^3 + 27b^2) \neq 0$ .

### 1.5.5 Fano variety

A variety X is Fano if the anticanonical sheaf  $\omega_X^{-1}$  is ample.

## 1.5.6 K3 surface

A K3 surface is a complex algebraic surface X such that the canonical sheaf is trivial,  $\omega_X \simeq \mathscr{O}_X$ , and such that  $H^1(X, \mathscr{O}_X) = 0$ . These conditions completely determine the Hodge numbers of X.

# 2 Commutative algebra

#### 2.1 Modules

#### 2.1.1 Depth

Let R be a noetherian ring, and M a finitely-generated R-module and I an ideal of R such that  $IM \neq M$ . Then the I-depth of M is (see Ext):

$$\inf\{i\mid \operatorname{Ext}^i_R(R/I,M)\neq 0\}.$$

This is also the length of a maximal M-sequence in I.

#### 2.2 Results and theorems

#### 2.2.1 The Unmixedness Theorem

Let R be a ring. If  $I = \langle x_1, \dots, x_n \rangle$  is an ideal generated by n elements such that codim I = n, then all minimal primes of I have codimension n. If in addition R is Cohen-Macaulay, then every associated prime of I is minimal over I. See the discussion after [2, Corollary 18.14] for more details.

## 2.3 Rings

## 2.3.1 Cohen-Macaulay ring

A local Cohen-Macaulay ring (CM-ring for short) is a commutative noetherian local ring with Krull dimension equal to its depth. A ring is Cohen-Macaulay if its localization at all prime ideals are Cohen-Macaulay.

### 2.3.2 Depth of a ring

The depth of a ring R is is its depth as a module over itself.

### 2.3.3 Gorenstein ring

A commutative ring R is Gorenstein if each localization at a prime ideal is a Gorenstein local ring. A Gorenstein local ring is a local ring with finite injective dimension as an R-module. This is equivalent to the following:  $\operatorname{Ext}_R^i(k,R) = 0$  for  $i \neq n$  and  $\operatorname{Ext}_R^n(k,R) \simeq k$  (here  $k = R/\mathfrak{m}$  and n is the Krull dimension of R).

#### 2.3.4 Normal ring

An integral domain R is **normal** if all its localizations at prime ideals  $\mathfrak{p} \in \operatorname{Spec} R$  are integrally closed domains.

# 3 Convex geometry

#### 3.1 Cones

#### 3.1.1 Gorenstein cone

A strongly convex cone  $C \subset M_{\mathbb{R}}$  is **Gorenstein** if there exists a point  $n \in N$  in the dual lattice such that  $\langle v, n \rangle = 1$  for all generators of the semigroup  $C \cap M$ .

#### 3.1.2 Reflexive Gorenstein cone

A cone C is **reflexive** if both C and its dual  $C^{\vee}$  are Gorenstein cones. See for example [1].

#### 3.1.3 Simplicial cone

A cone C generated by  $\{v_1, \dots, v_k\} \subseteq N_{\mathbb{R}}$  is **simplicial** if the  $v_i$  are linearly independent.

## 3.2 Polytopes

#### 3.2.1 Dual (polar) polytope

If  $\Delta$  is a polyhedron, its dual  $\Delta^{\circ}$  is defined by

$$\Delta^{\circ} = \{ x \in N_{\mathbb{R}} \mid \langle x, y \rangle \ge -1 \,\forall \, y \in \Delta \} \,.$$

## 3.2.2 Gorenstein polytope of index r

A lattice polytope  $P \subset \mathbb{R}^{d+r-1}$  is called a **Gorenstein polytope of index** r if rP contains a single interior lattice point p and rP - p is a reflexive polytope.

### 3.2.3 Nef partition

Let  $\Delta \subset M_{\mathbb{R}}$  be a d-dimensional reflexive polytope, and let  $m = \operatorname{int}(\Delta) \cap M$ . A Minkowski sum decomposition  $\Delta = \Delta_1 + \ldots + \Delta_r$  where  $\Delta_1, \ldots, \Delta_r$  are lattice polytopes is called a **nef partition of**  $\Delta$  **of length** r if there are lattice points  $p_i \in \Delta_i$  for all i such that  $p_1 + \cdots + p_r = m$ . The nef partition is called *centered* if  $p_i = 0$  for all i.

This is equivalent to the toric divisor  $D_j = \mathcal{O}(\Delta_i) = \sum_{\rho \in \Delta_i} D_{\rho}$  being a Cartier divisor generated by its global sections. See [1, Chapter 4.3].

### 3.2.4 Reflexive polytope

A polytope  $\Delta$  is **reflexive** if the following two conditions hold:

- 1. All facets  $\Gamma$  of  $\Delta$  are supported by affine hyperplanes of the form  $\{m \in M_{\mathbb{R}} \mid \langle m, v_{\Gamma} \rangle \}$  for some  $v_{\Gamma} \in N$ .
- 2. The only interior point of  $\Delta$  is 0, that is:  $Int(\Delta) \cap M = \{0\}$ .

## 4 Homological algebra

#### 4.1 Derived functors

#### 4.1.1 Ext

Let R be a ring and M, N be R-modules. Then  $\operatorname{Ext}^i_R(M, N)$  is the right-derived functors of the  $\operatorname{Hom}(M, -)$ -functor. In particular,  $\operatorname{Ext}^i_R(M, N)$  can be computed as follows: choose a projective resolution C of N over R. Then apply the left-exact functor  $\operatorname{Hom}_R(M, -)$  to the resolution and take homology. Then  $\operatorname{Ext}^i_R(M, N) = h^i(C)$ .

### 4.1.2 Local cohomology

Let R be a ring and  $I \subset R$  an ideal. Let  $\Gamma_I(-)$  be the following functor on R-modules:

$$\Gamma_I(M) = \{ f \in M \mid \exists n \in \mathbb{N}, s.t.I^n f = 0 \}.$$

Then  $H_I^i(-)$  is by definition the *i*th right derived functor of  $\Gamma_I$ . In the case that R is noetherian, we have  $H_I^i(M) = \varinjlim \operatorname{Ext}_R^i(R/I_n, M)$ .

See [2] and [4] for more details.

#### 4.1.3 Tor

Let R be a ring and M, N be R-modules. Then  $\operatorname{Tor}_R^i(M, N)$  is the right-derived functors of the  $-\otimes_R N$ -functor. In particular  $\operatorname{Tor}_R^i(M, N)$  can be computed by taking a projective resolution of M, tensoring with N, and then taking homology.
