Letter of Recommendation

To whom it may concern,

In the academic spring semester of 2015, I was Jan Henrik Wiik's supervisor in the project course MAT2000[1] at the University of Oslo.

In his project, Jan Henrik had to learn about Gröbner bases for ideals in the polynomial ring $\mathbb{Q}[x_1, \ldots, x_n]$. He then implemented the Buchberger algorithm in `Python`, which he then used to solve zero-dimensional systems of polynomials equations.

Jan Henrik was an independent and structured student. He had no trouble working on his own, and learning the required concept and algorithms. I do recommend him for any position that he is applying.

Best regards,

Fredrik Meyer, PhD student.
